

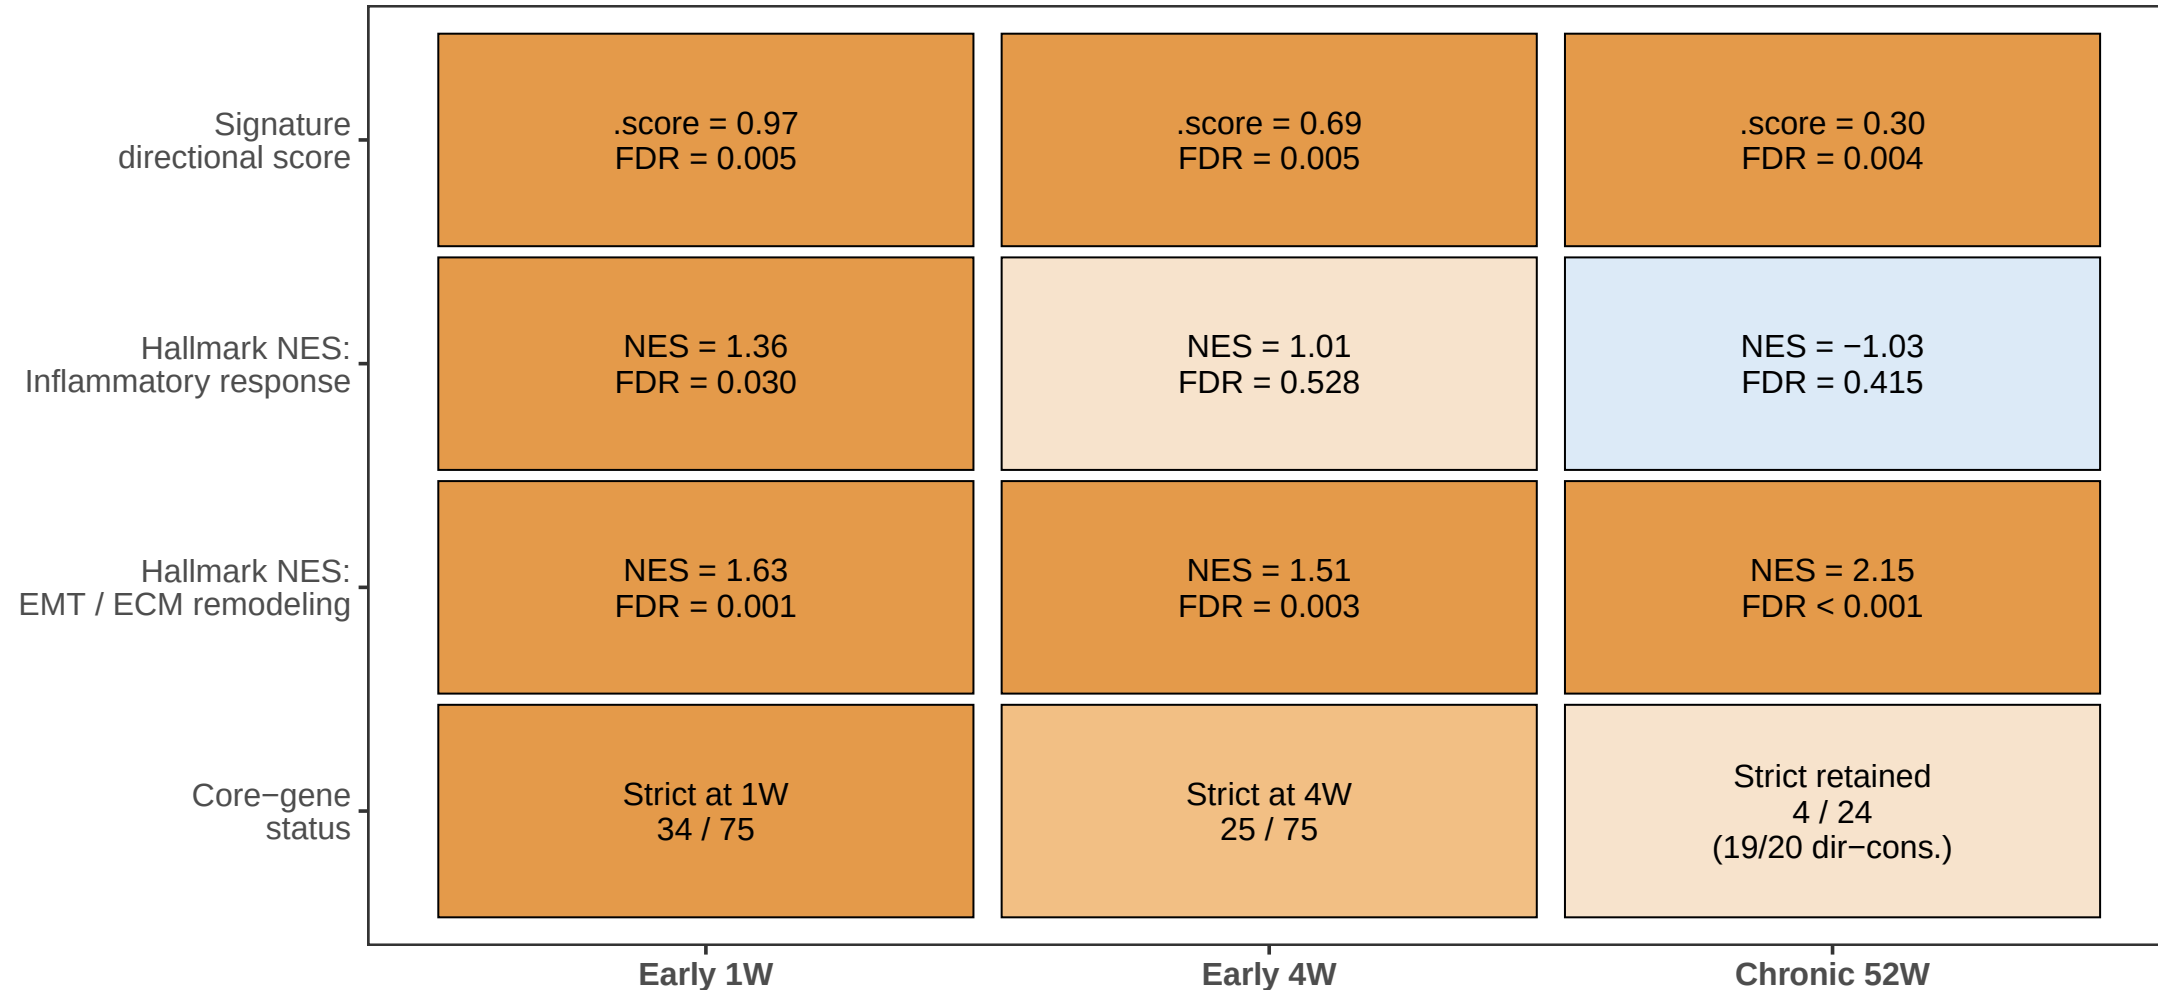

Figure 5D. Early-to-chronic comparison of the current78-derived pig synovial program

Fixed 75-gene signature and fixed early-defined 24 core genes projected from early to chronic pig synovium

Signature row: median directional-score difference (case – control) with FDR.

Hallmark rows: NES with FDR from full Hallmark fgsea.

Core-gene row: early strict counts among 75 signature genes, and chronic strict retained counts among the fixed early-defined 24 core genes.
